This Replication Archive folder includes the datasets and codes used with R and STATA for the empirical analysis of the article

Global Diffusion, Policy Flexibility, and Inflation Targeting

International Interactions

Here is brief description of the different files included in this folder:

– *Descriptive Analysis:*

The R-Code (*analysis.R*) produces the descriptive Figure 1 of the article using the dataset on adoptions (*IT_adoption.csv*).

– *Creation of dataset for the analysis:*

The Stata-Code (*create_riskset.do*) uses the time-series cross-section dataset with all variables (*full_data.csv*) to create the risk set structure of the dataset used for the analysis (*riskset_data.csv*) by dropping each country from the time-series dataset after it has adopted IT.

– *Empirical Analysis:*

The R-Code (*analysis.R*) constructs the spatial lag variables using the (*itflex_data.csv*), which codes for all countries the necessary information on the inflation targeting regime (target, ranges, adoption etc.). The R-Code (*analysis.R*) also produces all the empirical results presented in the tables and figures of the article as well as the online appendix using the risk set dataset (*riskset_data.csv*) and the constructed spatial lags.
